Listing of Claims

1-22. (canceled)

23. (new) A device for supporting a panel on a base in a substantially vertical position, perpendicular to thrust of a fluid that moves relative to the panel and to the base, the device comprising:

at least two support arms, at least one of said at least two support arms being located on each of opposite sides of the panel;

at least two elastic means, each of said at least two support arms having one end directly linked to the panel and an opposite end linked to a first end of a respective one of said at least two elastic means; and

at least two removable fastening means repositionable on the base, wherein an end of each of said at least two elastic means opposite said first end is attached to a respective one of said at least two removable fastening means,

wherein said at least two elastic means are in a plane different from a plane of the panel and are arranged so that when the fluid exerts thrust on the

panel, at least one said at least two elastic means undergoes a compression and at least one said at least two elastic means undergoes an extension in order to maintain an initial position of the panel.

24. (new) The device of claim 23, further comprising at least three said elastic means.

25. (new) The device of claim 23, wherein said at least two elastic means are springs.

26. (new) The device of claim 23, wherein said at least two removable fastening means are magnets.

27. (new) The device of claim 23, wherein said at least two removable fastening means are suction cups.

28. (new) The device of claim 23, wherein said at least two support arms are brackets having a substantially triangular shape, one side of said substantially triangular shape being arranged to be attached to the panel.

29. (new) The device of claim 28, wherein said at least two support arms are part of a support plate constituted by said at least two support arms coupled together by said one side that is arranged to be attached to the panel.

30. (new) The device of claim 23, further comprising the panel, wherein said panel is one of a two-sided display and a cylindrical display.

31. (new) The device of claim 30, wherein said panel, in cross-section, is triangular.

32. (new) The device of claim 31, wherein two opposite faces of said panel having a triangular cross-section are concave.

33. (new) The device of claim 23, further comprising the base, wherein a location of said base is fixed.

34. (new) The device of claim 23, further comprising the base, wherein a location of said base is movable.
